

1. Explain situations / examples where would you use a primary key.

1. Definition: primary key identifies each record uniquely in a table.

When there is a record like Students data having same department, same name, same age there we should use the primary key to identify them uniquely.

2. Index

It is an database object that helps the database object find data faster.

When the database has the largenumber of records we will create an index for any of the

Column.

Without index the database scans all the records.

2. Foreign Key

Foreign key is column in one table that refers to the primary key of another table.

Whenever you want to link two tables and ensure that related data exists.

3. Can you use a subquery in DMLs like update / delete?

No

The concept of subquery is to the innerquery will execute first and sends the results to the outerquery. If we perform any operations like insert, update or delete commands that will not return any values

So that the outer query will execute.

We can use the DML commands in the outer query and in the inner query we can write the conditions.
